## Artificial Intelligence- to Improve Education

\*Mr. Nabage A. D.

\*\*Mr. Datir K. R.

---

### INTRODUCTION-

Introduction to the new technology is the future of higher education. Progress in this field, changes in education in higher educational institutions, education and challenges are possible.

Artificial intelligence may focus on the conditions required to improve the syllabus. Teachers do not always know about the distance between their lectures and educational material, which can confuse students with some concepts. In most classrooms, we do not know the potential of children, but students of various courses and materials can be interested and exposed by using this artificial insemination. Artificial intelligence provides a way to solve the problem when a large number of students submit a wrong answer to the homework assignment, this system alerts the teachers and at the same time gives the students timely messages about their wrong answer.

**Artificial intelligence can automate basic activities in education, like grade system:** In schools or colleges, testing for homework grades and large lecture courses can be difficult, even if the TA has divided them into them. In the lower class, teachers also have time to get a lot of time in grading, which can be used to communicate with students, to create class or to work on commercial development. The AI is not yet able to take up the position of human grading, it is getting very close. Teachers can automate grading for almost all kinds of multiple choices.

**AI will provide additional support for the students-**due to the AI- which will provide additional support to the students by the teacher- Although it is clearly evident that such human technologies can give such devices, it is possible for more students to be taught through future teachers. Some educational programs based on artificial intelligence already exist and can help students through basic math, writing, and other subjects. These programs can teach students the basics, but are not yet ideal to help students learn high-quality thinking and creativity, but teachers in the real world must still make it easy. Still AI technicians cannot deny the possibility that they can do these things in the future.

**AI-driven programs can give students and educator's helpful feedback-**Using artificial intelligence will help in creating a coaching course to suit the educational needs of the students. The shortage of children is being shown due to the AI system, so that the children can improve themselves and teachers will see the children as per their intelligence and the children will develop accordingly.

**AI could change the role of teachers:** - New technologies can change the role of intelligent computer systems. AI can check quality, AI system can help students improve education and quality. Artificial intelligence has been adopted in many other ways. You can also use it to ask questions and to find information and to improve the skills of students. The role of teachers in the field of education is important. And this artificial intelligence can be more beneficial for the children by increasing the intellectual capacity of the children.

**AI may change where students learn, who teaches them, and how they acquire basic skills-**In the next few decades, the ability to make good changes in the educational system is in this artificial intelligence and if you use it you can make good changes in your education system in the next few years, so that children can help in better education. And children can make good changes in their lifestyle.

### • CONCLUSION-

The above information suggests that if you use artificial intelligence in your education field, it will be good for improving our education system and it will be a good result for our students, that is, they will be able to adapt their interest so that they can make their own life more enjoyable with artificial intelligence. Make better use.
